SAS'9 - Perl Regular Expressions Tip Sheet

Functions and Call Routines

regex-id = prxparse(perl-regex)

Compile Perl regular expression *perl-regex* and return *regex-id* to be used by other PRX functions.

pos = prxmatch(regex-id | perl-regex, source)

Search in *source* and return position of match or zero if no match is found.

new-string = prxchange(regex-id | perl-regex, times, old-string)

Search and replace *times* number of times in *old-string* and return modified string in *new-string*.

call prxchange(regex-id, times, old-string, new-

string, res-length, trunc-value, num-of-changes)
Same as prior example and place length of result in
res-length, if result is too long to fit into new-string,
trunc-value is set to 1, and the number of changes is
placed in num-of-changes.

text = prxposn(regex-id, n, source)

After a call to **prxmatch** or **prxchange**, **prxposn** return the text of capture buffer *n*.

call prxposn(regex-id, n, pos, len)

After a call to **prxmatch** or **prxchange, call prxposn** sets **pos** and **len** to the position and length of capture buffer **n**.

call prxnext(regex-id, start, stop, source, pos, len)
Search in source between positions start and stop.
Set pos and len to the position and length of the match. Also set start to pos+len+1 so another search can easily begin where this one left off.

call prxdebug(on-off)

Pass 1 to enable debug output to the SAS Log. Pass 0 to disable debug output to the SAS Log.

call prxfree(regex-id)

Free memory for a regex-id returned by prxparse.

Basic Syntax

Character Behavior /.../ Starting and ending regex delimiters | Alternation () Grouping

Wildcards/Character Class Shorthands

Character Classes

Character Behavior [] Match a character in the brackets [^] Match a character not in the brackets [a-z] Match a character in the range a to z.
a on a Sum I can an income a recent if

Position Matching

Behavior	Match beginning of line	Match end of line	Match word boundary	Match non-word boundary
Character	<	↔	q\	\B

Repetition Factors

(greedy, match as many times as possible)

(gice	(greedy, matemas many times as possible)
Character	Behavior
*	Match 0 or more times
+	Match 1 or more times
خ	Match 1 or 0 times
{u}	Match exactly n times
{u'}	Match at least n times
{ w ' u }	Match at least n but not more than m
	times

Advanced Syntax

Character	Behavior
non-meta	Match character
character	
{}[]()~	Metacharacters, to match these
⟨:+* .\$	characters, override (escape) with \
/	Override (escape) next metacharacter
<i>u</i> \	Match capture buffer n
(:::)	Non-capturing group

Lazy Repetition Factors

(match minimum number of times possible)

Character	Behavior
٠ *	Match 0 or more times
ċ+	Match 1 or more times
ċċ	Match 0 or 1 time
¿{u}	Match exactly n times
; { u }	Match at least n times
¿{ш'u}	Match at least n but not more than m
	times

Look-Ahead and Look-Behind

Character	Behavior
(:=:)	Zero-width positive look-ahead
	assertion. E.g. $regexI$ (?= $regex2$),
	a match is found if both regex1 and
	regex2 match. regex2 is not
	included in the final match.
(5!)	Zero-width negative look-ahead
	assertion. E.g. $regex1$ (?! $regex2$),
	a match is found if regex1 matches
	and regex2 does not match. regex2
	is not included in the final match.
(:->:)	Zero-width positive look-behind
	assertion. E.g. ($? <= regexI$) $regex2$,
	a match is found if both regex1 and
	regex2 match. regex1 is not
	included in the final match.
(:><:)	Zero-width negative look-behind
	secention

SAS 9 - Perl Regular Expressions Tip Sheet

Basic Example

Data Validation

```
proc sql; /* Same as prior data step */
                                                                                                                                                                                                                                                                                                                                                                                                         "[2-9]\d\d-\d\d\d\d\",phone);
                                                                                                                                                                                                                                                          "[2-9]\d\d-\d\d\d\",phone);
                                                                                                           (508) 852-2146
                                                                                                                                                                                                                                     prxmatch("/\([2-9]\d\d\) ?" ||
                                                                                                                                                                                                                                                                                                                                                                                     prxmatch("/\([2-9]\d\d\)?" ||
                                    input first last phone & $16.;
                                                                    (919)319-1677
800-899-2164
                                                                                                                           (252)152-7583
                length first last phone $ 16;
                                                                                                                                                                                                                                                                                                                                                   select * from phone_numbers
